FEATURE SHEET · TOOL CRIB MANAGEMENT · TOOL CHECK-IN / CHECK-OUT

Know Who Has Every Tool. Keep Tools Due for Calibration Off the Job.

SmartStock Select, powered by eTurns TrackStock, records every tool that leaves and returns to your crib, trailer, or truck. Scan the tool and select the tech, and you always know who last had it, when they took it, and whether it is due for service.

Who & When
recorded on every check-out, so you can see who last had any tool

Locked
tools due for calibration or service cannot be checked out until they are back in inventory

Up to 80%
less time spent checking tools in and out

THE PROBLEM BEING SOLVED

Tools walk. A drill goes out on Monday, and by Friday nobody can say who has it. The team buys a replacement, and the original turns up in a truck a month later.

Calibration is the costlier miss. A torque wrench or meter that is past due keeps going out to jobs because nothing stops it, and nobody notices until the work has to be redone.

Many contractors want to track every tool, even everyday ones like hammers and extension cords. A paper sign-out sheet cannot keep up once the program grows past one location.

WHAT IT TRACKS

- Expensive tools with their own serial numbers, one by one
- Multiples of identical tools, like extension cords, under one item
- Tool status: checked out, available, or out for service
- Full maintenance history for any tool, on demand

HOW CHECK-IN / CHECK-OUT WORKS

1. **Check Out: Scan the Tool and Select the Tech**
   The crib manager scans the tool and selects the technician. TrackStock assigns serial numbers to tools that do not have one, so even common tools can be tracked by person.

2. **Check In: One at a Time or All at Once**
   Returned tools are scanned back into inventory individually or in a batch at the end of a shift. The record of who had each tool and when stays in the system.

3. **Calibration and Service Lockout**
   Set service alerts by calendar date, operating hours, or number of uses. Techs get an email before maintenance is due, and TrackStock blocks check-out of any tool that needs calibration until it is serviced and returned to inventory.

4. **Work Orders That Restock Parts**
   Log scheduled and unscheduled maintenance on a work order with a quicklist of the parts, kits, and labor a tool usually needs. Adding items to the work order triggers replenishment of the parts used.

Expanding tool checkout to more sites?

Talk to your Graybar rep about adding tool check-in and check-out to SmartStock Select across every crib, trailer, and truck in your program.
